

PEAK Class 101: Digital Photo Frames

Simply put, a DPF, or digital photo frame, is an electronic device that can display your digital photos without the need to print them out or load them on a computer. Pictures taken from your digital camera can be displayed brilliantly on your favourite digital photo frame in seconds, without the aid of your computer system, but of course you can still connect your camera to the PC to download and store pictures. In addition to photo display, you can also create slideshows with cool transitions to display all of your favourite pictures, even with background music. Many cool features have been added to the DPF, such as MP3 playback, video playback, Wi-Fi and even Bluetooth wireless connection.

Dimensions

Most DPFs on the market feature a 7"~10" LCD display. Although you can find frames that are bigger than 10"; a 7" or 8" frame is currently the sweet spot for most users under most conditions. Most digital photo frames can display JPEG and BMP images flawlessly on their built-in LCD screen with ease. Just like your LCD monitor, you can also adjust the brightness and contrast of your digital photo frame for perfect viewing.

Expandability

Your camera memory cards can be inserted directly into the DPF to display your pictures. Some digital photo frames also have built-in internal memory, thus eliminating the need for a memory card. Most DPFs will accept a wide variety of flash memory cards for maximum compatibility.

Multimedia

On top of displaying still and moving digital images, almost all digital photo frames on the market now support MP3 / WMA playback. Simply transfer the supported music onto the DPF and you can use it as a mini MP3 player for music playback during your photo slideshow. Some DPFs will even support movie (mp4/Divx) playback natively.

Extra features

More and more useful features have been added to the latest DPFs. With a Wi-Fi wireless connection, you can stream your favourite photos from the online photo storage service right to the digital photo frame, wirelessly. With Bluetooth technology, photos taken with your mobile phone can be streamed wirelessly to the frame with ease.

A PEAK Digital Photo Frame is the perfect gift for all occasions. For more information, please visit us at www.peakhardware.com
